

Amazing International Airlines Inc.

Data-driven insights for Customer Strategy

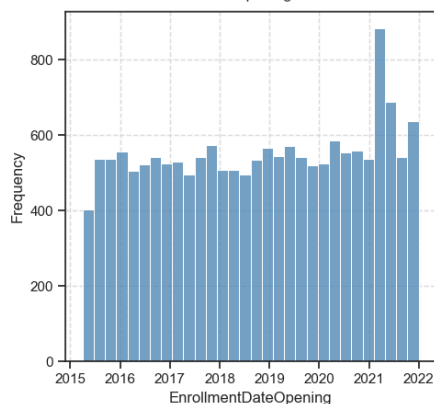

Group 12 - Luis Mendes, 20221949 | Margarida Ourives, 20221809 | Simon Sazonov, 20221689 | Veronica Mendes, 20221945

Customers dataset

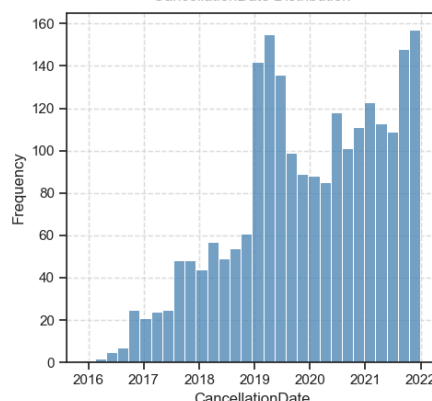

- 16,572 Loyalty members.
- 1,471 customers have not yet booked a flight.

EnrollmentDateOpening Distribution

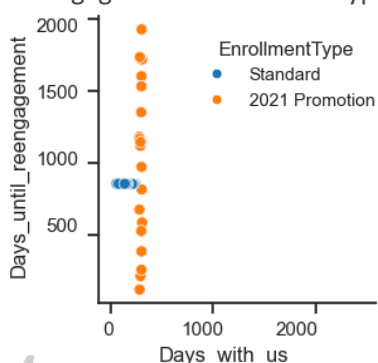

- Customer enrollments have remained steady over time since the start in 2015, showing consistent interest in the loyalty program.
- A peak occurred in 2021 when a promotion was launched.

CancellationDate Distribution

- However, cancellations have been rising, suggesting that some members may be disengaging or dissatisfied.
- Understanding why customers leave will be key to improving retention and loyalty.

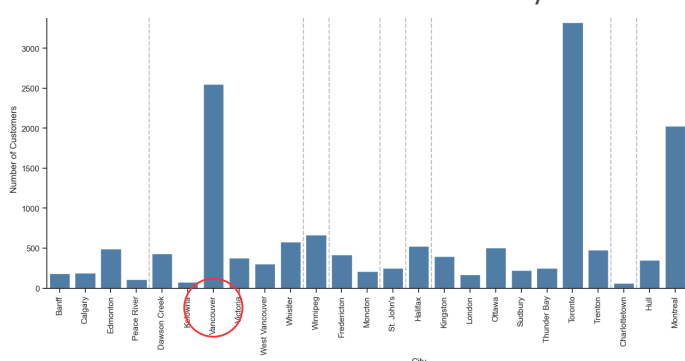

Reengagement Enrollment Type

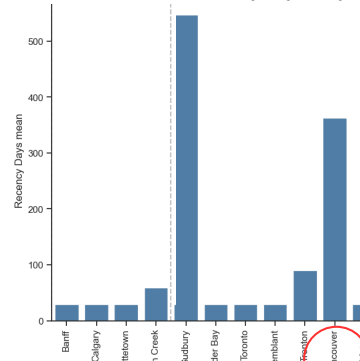

- There are two groups of re-engaged customers: those who joined on the same day as the 2021 promotion, and those who returned after approximately 850 days, possibly due to a special campaign or program that was activated following a long period of inactivity.

Geographical Analysis

Number of Customer Per City

Median Recency by City

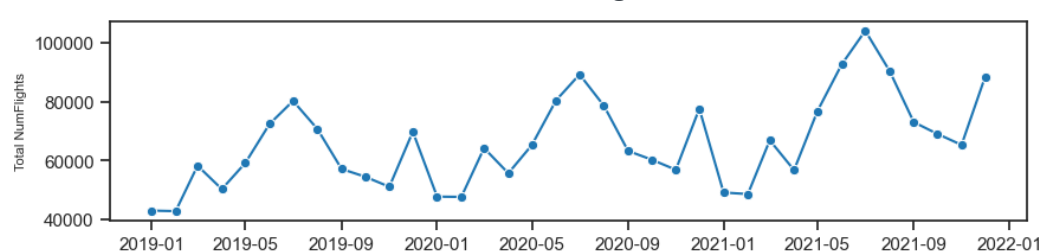

- Each city had a different number of customers. The cities with the highest number of customers are Vancouver (approx. 2,500), Toronto (approx. 2,000), and Montreal (approx. 3,300).
- However, despite Vancouver being one of the cities with the most customers, it had a median of 363 days without any purchases, which needs to be addressed.

Flights dataset

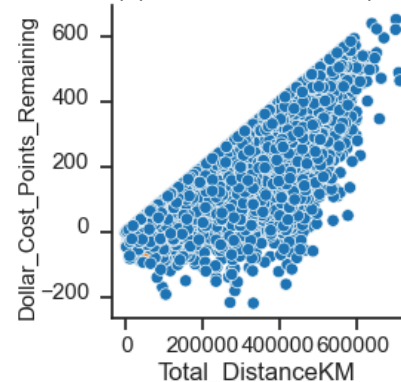

- 302,305 flight activity records.
- Captures 3 years of customer travel history (2019 to 2021).

Evolution of number of flights over time

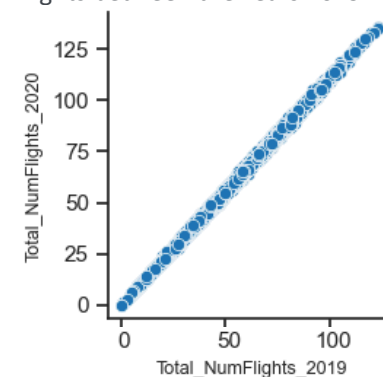

- Overall flight activity is growing each year.
- Travel demand peaks in summer and holidays.
- Lowest travel periods: January–February.

Relationship between Remaining Points (\$) and Total Distance (KM)

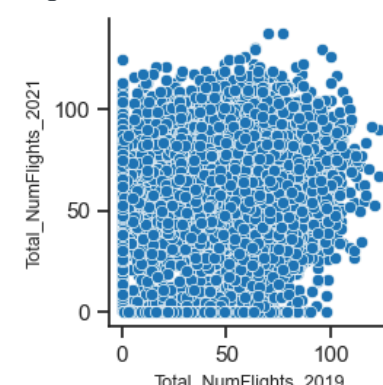

- Clearly exists a pattern of customers who only travel and accumulate points without using them, while other types of customers are more promotion-sensitive and actively redeem their points.

Relationship between Number of Flights between the Years 2019–2020

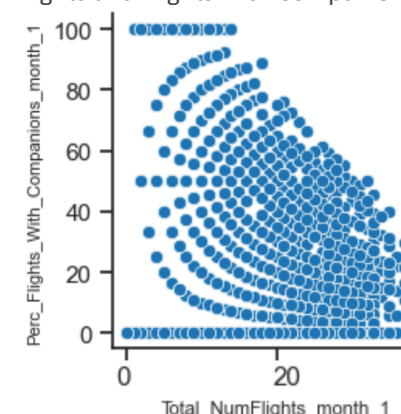

Relationship between Number of Flights between the Years 2019–2021

- There is a strong relationship between customer behavior in 2019 and 2020. However, the year 2021 shows a pattern with no correlation to historical trends, suggesting that a specific event or action during that year altered typical behavior.

Relationship between Number of Flights and Flights with Companions (%)

- Some customers travel exclusively with companions, while others always travel alone. However, the more frequently a person flies within a given period, the less likely they are to travel with companions. This trend remains consistent across different years and months.

Results

To summarize, if Amazing International Airlines Inc. wants to maintain positive trends in profits and transactions, it needs to develop a segmentation strategy that understands and addresses the needs of different types of customers — for example, frequent travelers, occasional travelers with companions, “point hoarders,” and “promotion-sensitive redeemers.”

This can be achieved by creating differentiated reward structures and using data-driven insights to guide customer strategies, similar to past promotions that successfully reactivated previously inactive customers. Without such action, customer cancellations are likely to continue increasing, and many customers — such as those in Vancouver — may never re-engage. Therefore, immediate action is required.
